

Should Health Technology Assessment (HTA) Bodies Utilize Living HTA Tools? Validation of LiveSLR® and LiveNMA™ Tools Using ICER'S Class Review in Relapsed Refractory Multiple Myeloma (RRMM)

HTA35

Introduction

BACKGROUND

- Living HTA has been suggested as an innovative approach to address challenges in the current HTA processes.
- One of the key challenges is how to systematically review an increasingly higher volume of evidence while ensuring unbiased and timely decisions are made for the assessment of new technologies.¹
- With the increasing volume of scientific literature, updating a network meta-analysis with new publications is time-consuming.

OBJECTIVE

- To address the difficulty in updating a network meta-analysis (NMA) with new evidence, we investigated the validity of LiveSLR® and LiveNMA™ tools in supporting the Living HTA concept by creating efficiencies while replicating and updating the RRMM class review NMA produced by the Institute for Clinical and Economic Review (ICER)².

METHODS

- LiveSLR is an up-to-date Cochrane/NICE-compliant curated library of systematic literature reviews (SLRs) following PRISMA standards and separated by indication. Figure 1 shows a screenshot of LiveSLR overviewing its features in filtering an existing database and producing customized reports.
- LiveSLR is maintained by a team of trained health economics and outcomes research (HEOR) professionals with immediate congress abstracts updates and bi-annual published literature database searches.
- LiveNMA is an R-based tool that performs Bayesian NMAs for overall survival (OS) and progression-free survival (PFS). Figure 2 shows a screenshot of LiveNMA on the data review page with studies loaded from the LiveSLR library.
- Randomized controlled trials (RCTs) in RRMM reporting PFS published at the time of ICER's 2016 report² were systematically selected from the LiveSLR library (Table 1).
- The LiveNMA tool was used to perform the NMA, and results (network, hazard ratios, and ranking) were compared to ICER's original report.
- Then, both the review and analyses were updated with new evidence identified through April 2022 and observations were made regarding efficiencies in the process and impact on results.

Figure 1. A screenshot of LiveSLR and its functionality in search and filter, and report generation

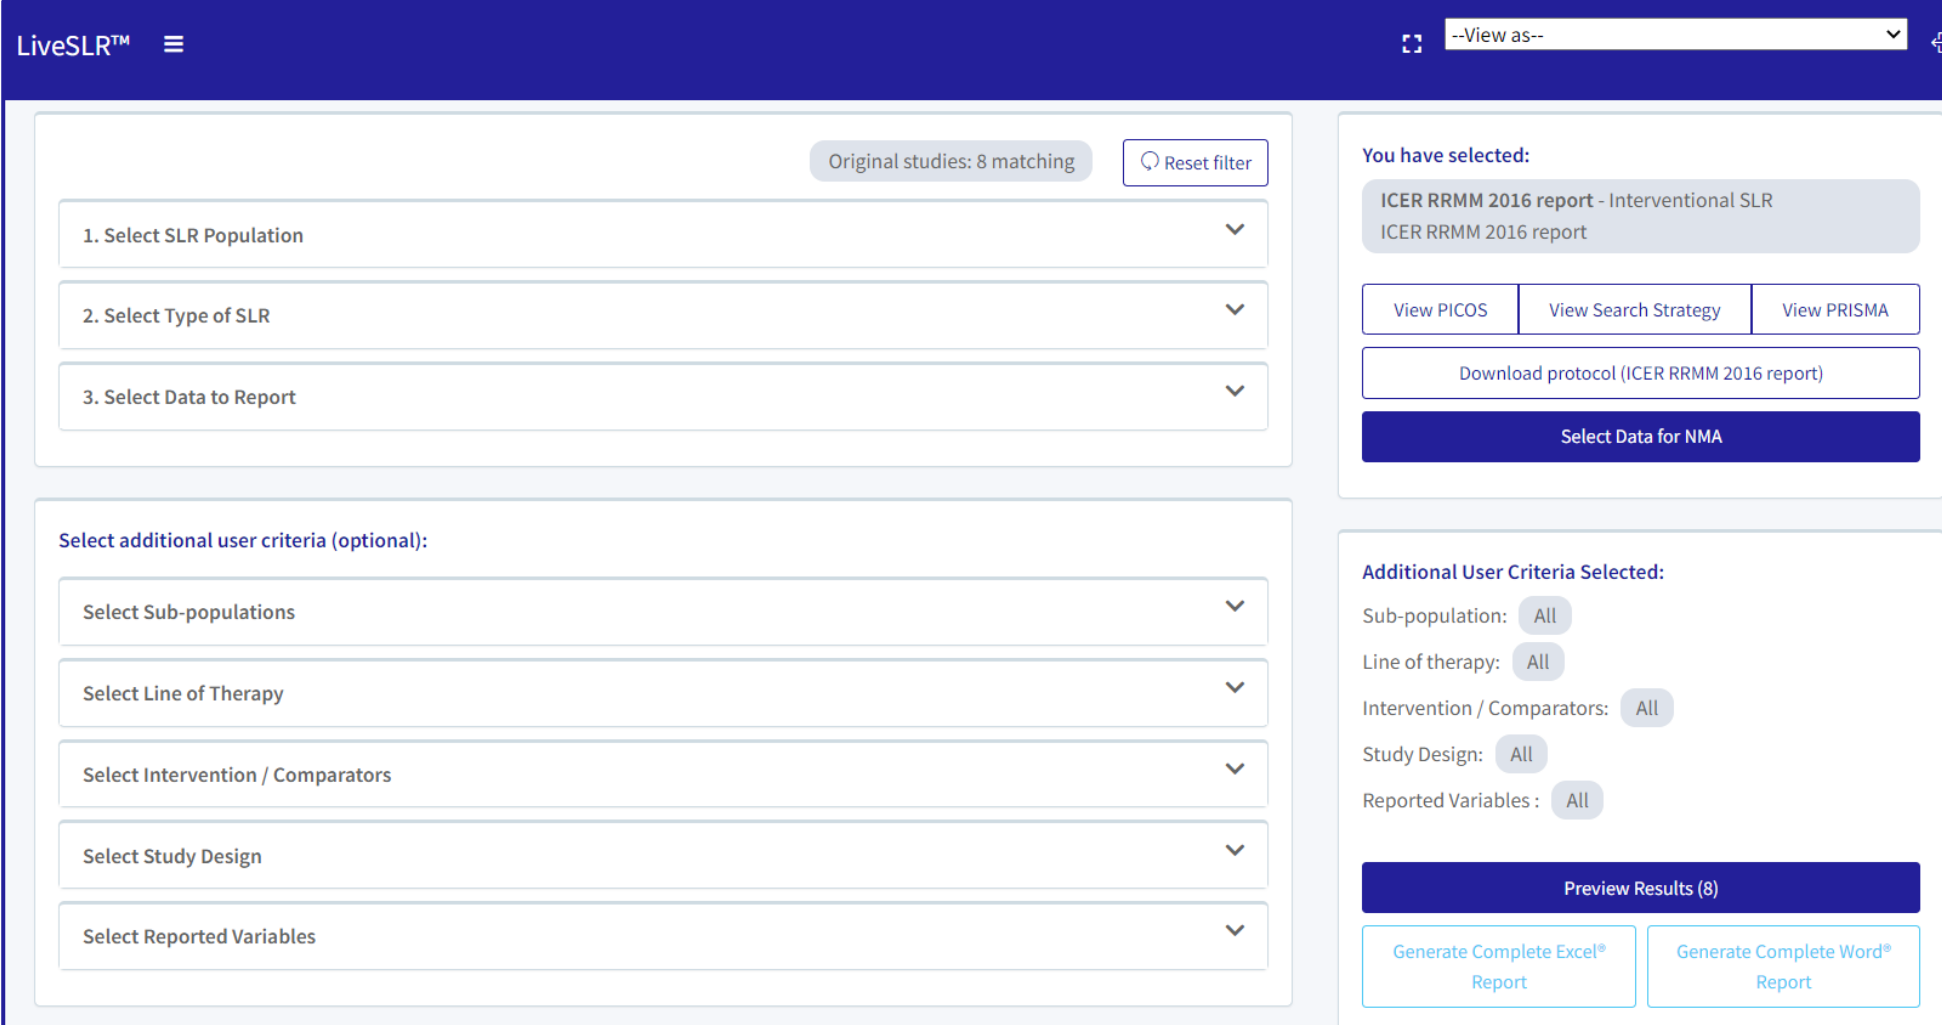

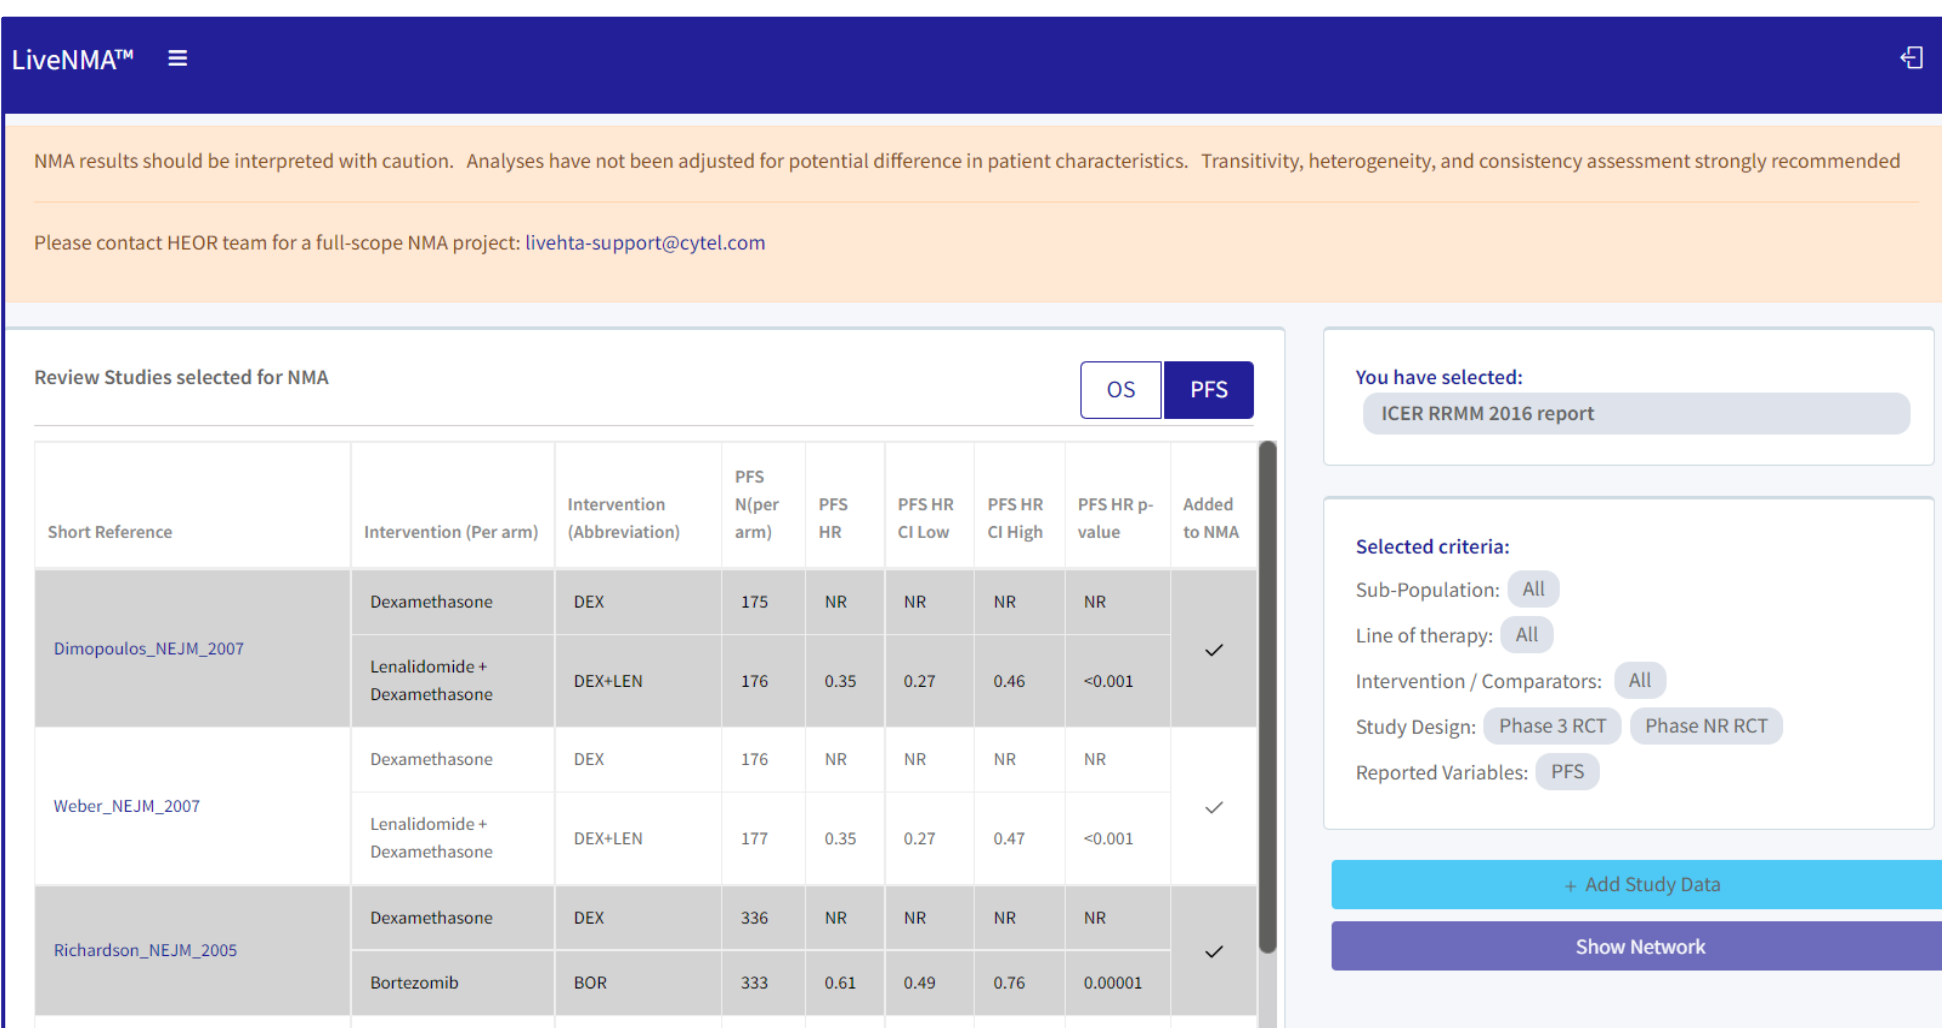

Figure 2. A screenshot of LiveNMA™ data review page after studies have been loaded from LiveSLR®

Conclusions

- This use-case showed that LiveSLR/LiveNMA can
 - replicate the results produced by ICER; and
 - provide up-to-date and high-quality results with limited effort
- Living HTA can only become a reality through the adoption of automated tools and platforms.
- LiveSLR/LiveNMA are validated tools that can become a significant component of living HTA.
- More research is required to understand payers' challenges in routine integration of such tools in their processes.

LIMITATIONS

- In the ICER report, only a real-world evidence (RWE) study was available to connect the network, therefore, caution should be exercised in terms of the quality of data.
- The LiveNMA tool currently does not consider adjustments for potential differences in patient characteristics between studies. Moreover, transitivity, heterogeneity, and consistency assessment are not considered in LiveNMA.

Results

Validation of LiveNMA by reproducing ICER NMA in RRMM

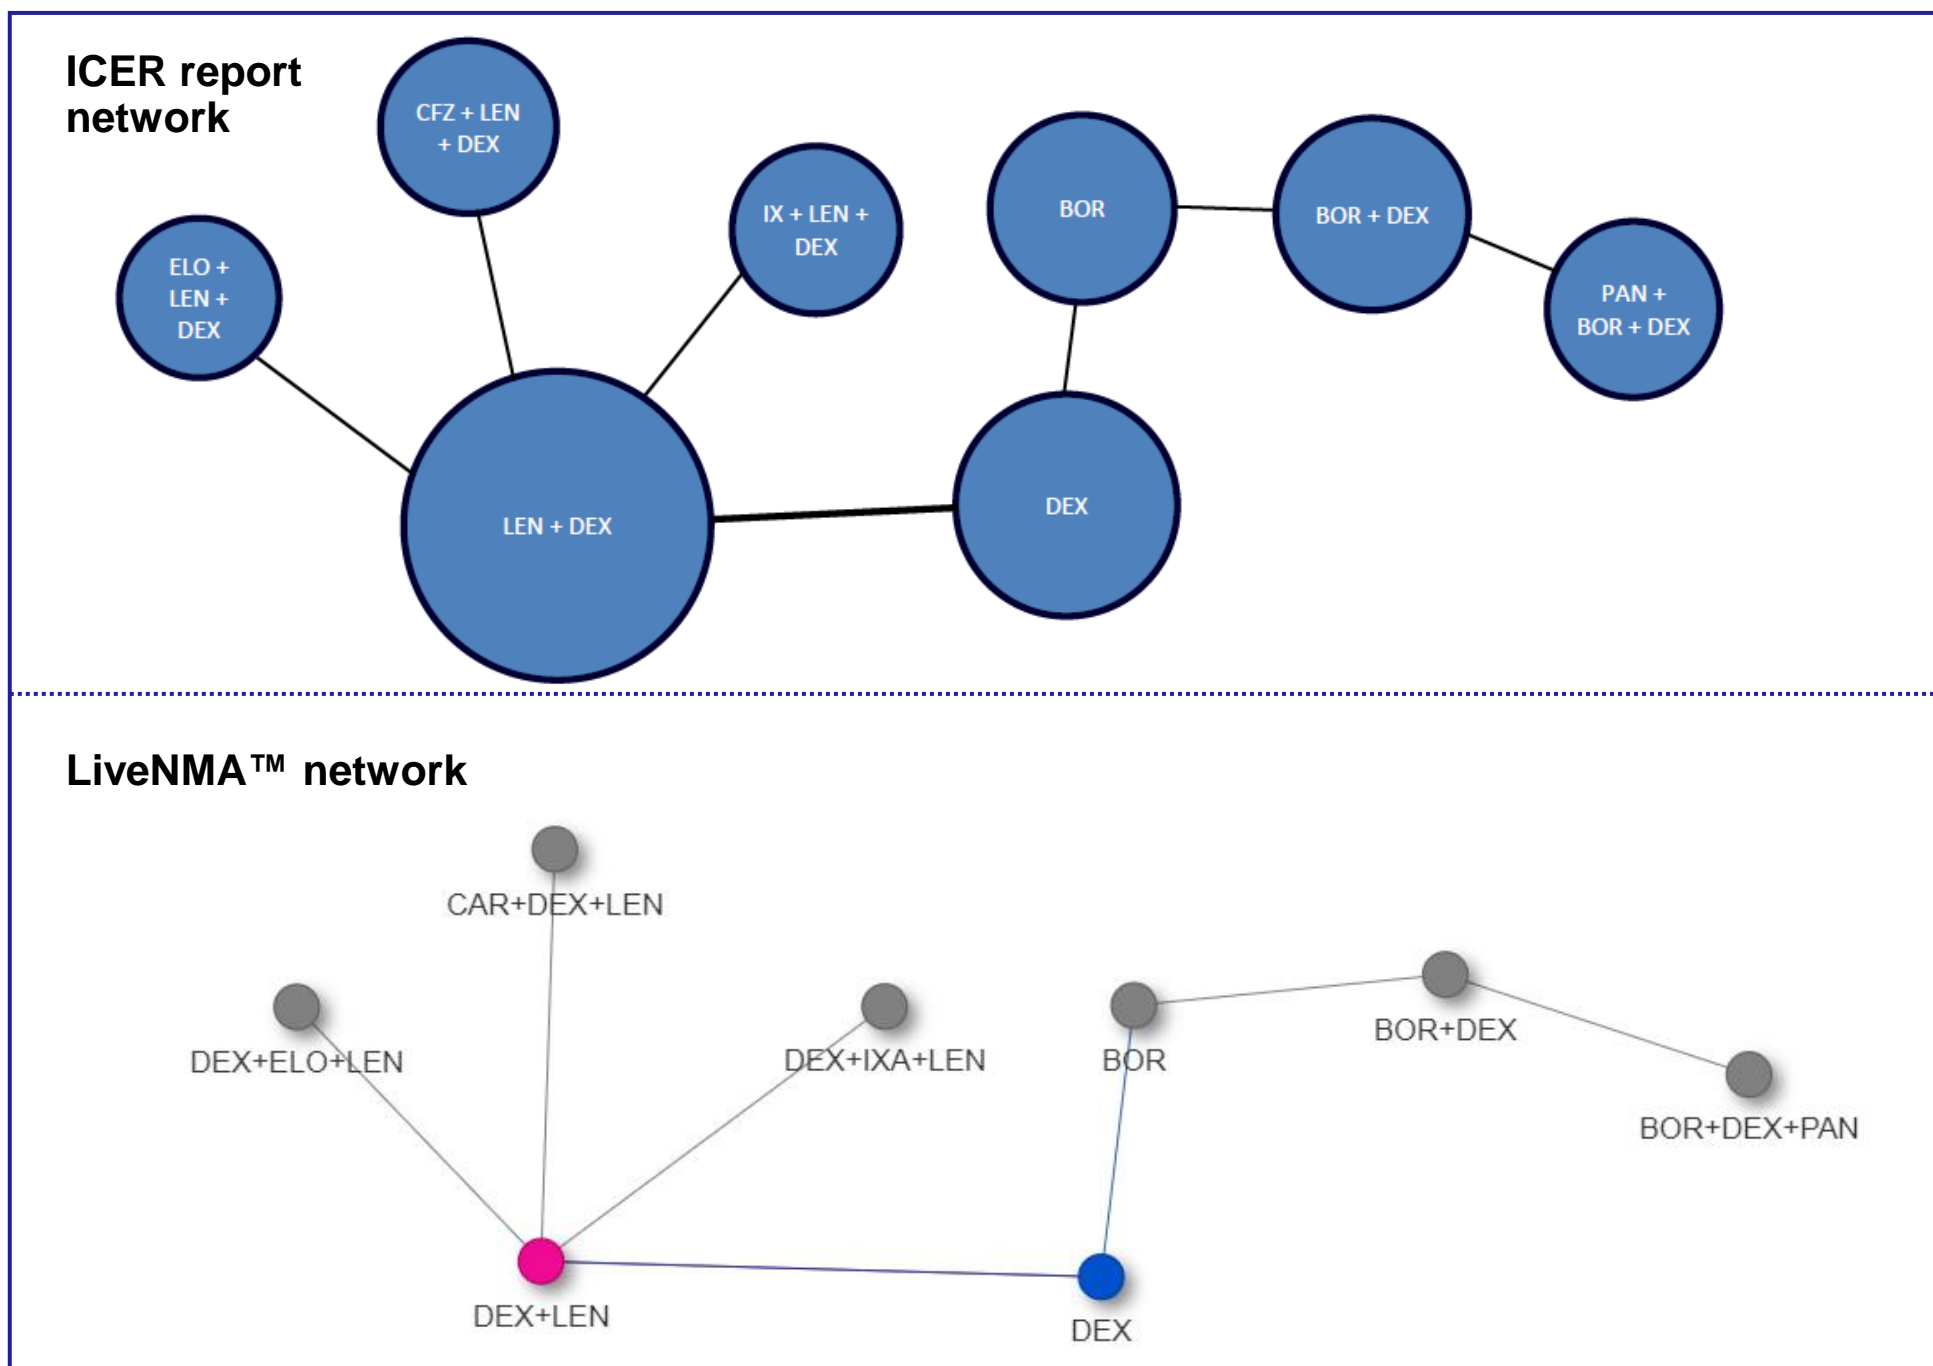

- All studies in the ICER report were readily available in the LiveSLR library (Table 1) and LiveNMA was able to replicate ICER's findings in under 10 minutes (Figure 3 for networks and Figure 4 for model calculation).

Update of ICER's NMA using new studies since 2016 from LiveSLR

- In addition to reproducing ICER's NMA from 2016, the real-time LiveSLR library contained 22 new trials of 23 new regimens published since the original ICER report (Table 2).
- The updated NMA showed daratumumab-bortezomib-dexamethasone, isatumimab-carfilzomib-dexamethasone, and daratumumab-carfilzomib-dexamethasone as the three highest-ranking regimens. Figure 5 shows the new network with additional regimens. Figure 6 shows the updated forest plot with the 3 highest-ranking regimens highlighted.
- The NMA update took 10 minutes to perform, creating significant efficiencies in analyses.
