## **HEALTHCARE RESOURCE UTILIZATION OF PATIENTS WITH SHORT BOWEL SYNDROME DEPENDENT ON PARENTERAL SUPPORT: A RETROSPECTIVE CLAIMS ANALYSIS**

Ahan Ali<sup>1</sup>; Dejan Micic, MD<sup>2</sup>; Mark Gallivan, MPH<sup>1</sup>; Aishwarya Kulkarni<sup>1</sup>; Jeff Henderson<sup>3</sup>; Gail Mitchell<sup>3</sup> <sup>1</sup>Trinity Life Sciences, Waltham, MA, USA; <sup>2</sup>University of Chicago Medical Center, Gastroenterology, Hepatology, and Nutrition, Chicago, IL, USA; <sup>3</sup>Ironwood Pharmaceuticals, Boston, MA, USA

## INTRODUCTION

- Short bowel syndrome (SBS) dependent on parenteral support (PS), also known as SBS with intestinal failure (SBS-IF), is a debilitating malabsorptive condition often caused by massive resection of the intestine, leading to reduction in intestinal function below the minimum necessary for nutrient and fluid absorption to maintain health, growth, and survival<sup>1,2,3</sup>
- Although PS is lifesaving, complications including catheter-related bloodstream infections, sepsis, and catheter-related central venous thrombosis/deep vein thrombosis (DVT) may occur<sup>1,40</sup>
- There is limited real-world data on the impact on HCR
- Economic burden for SBS dependent on PS is high with major drivers that increase healthcare resource utilization (HCRU), including PS costs and complications, symptom management, and emergency room visits<sup>5,6</sup>

## OBJECTIVES

- The aim of this real-world analysis was to assess HCRU of SBS patients dependent on PS
- To capture symptoms; comorbidities; nutrition/medication utilization; healthcare provider interactions, such as laboratory tests, physician office/outpatient/emergency department visits, and inpatient admissions/stay

## METHODS

- An observational retrospective, real-world analysis of insurance claims between January 2019 and March 2023 was conducted using Komodo Healthcare Map<sup>™</sup> data (**Table 1**)
- Patients were indexed at first observed PS insurance claim and classified with SBS dependent on PS if they had (1) chronic and continuous PS claims for  $\geq 6$  months, (2) intestinal resection or congenital abnormality history, and (3) concurrent diagnosis of intestinal malabsorption
- Descriptive statistics were used to capture the HCRU outcomes of the overall cohort and separately for age, nutrition claims, and surgery status sub-cohorts

## Table 1 | Cohort Attrition

	-	
Step	Description	Ν
1	Any nutritional support code	20,496,023
2	Chronic nutrition (≥2 nutrition codes [>1 PN or hydration] >6 months apart)	2,308,576
3	Continuous nutrition (average ≥2 nutrition codes per month for >6 months)	104,911
4	Surgical/congenital origin of SBS	46,175
5	Diagnosed malabsorption	11,592
6-10	<ul> <li>Exclude patients with</li> <li>6. &lt;3 years of continuous enrollment before nutrition start</li> </ul>	3,550

Inpatient admi Discussion

## Conclusions

and greater HCRU

- 2003;17(6):931-942.

Disclosures: The study was sponsored by VectivBio, now part of Ironwood Pharmaceuticals, Inc. G Mitchell and J Henderson are employees of the study sponsor. A Ali, M Gallivan and A Kulkarni received service fees as consultants who designed and executed the study. D. Micic is an external advisor for the study and provided support in data analysis.

Figure 3   Healthca	Annualized visit rate/year				
% of Patients				Mean	Median
Lab procedures			100%	35	29.3
Office visits			100%	54.3	42.1
Homecare			100%	53.4	28.7
Outpatient			99%	19.3	11.3
Emergency department visits		85%		4.5	2.1
Inpatient admission	7	5%		2.6	1.7

• Among healthcare provider interactions, 85% of patients visited the emergency department (mean, 4.5 visits/year) and 75% were admitted as inpatients (mean, 2.6 visits/year) (Figure 3)

- Among all patients (n=1,587), the most common diagnoses leading to an emergency department visit was abdominal pain (22%) and fever (15%) and to inpatient care was catheter-related bloodstream infections (36%) and sepsis (19%)

## **DISCUSSION & CONCLUSIONS**

 Comorbidities and symptoms with clinical and economic burden were frequent, which can potentially impact long-term HCRU costs

• Across sub-cohorts, catheter-related bloodstream infections were higher in patients receiving more nutrition claims and lower in patients who received surgery >12 months ago compared to those who had received surgery within <6 months

Catheter-related central venous thrombosis/DVTs were generally consistent

 Patients with SBS dependent on PS demonstrated high rates of emergency department and inpatient encounters, often from PS-related complications

• Study limitations include those inherent to analyses based on claims data

• Future treatments should aim to minimize the frequency of PS administration, which is associated with elevated risk of catheter-related bloodstream infections
